Parts of a tool: Raider BioLab

Every tool uses the same layout, shown here with Enzyme activity. Some tools add or leave out a part.

Guided mode

Every tool opens here. Students see one step at a time, then answer predictions one at a time.

1. Detail. Changes how many names, controls and how much math students see. Any student can choose any level.

2. Mode buttons. Switch between Guided, Full lab and any other modes this tool has.

3. Simulation. The model running live. Guided mode dims the parts that are not being explained.

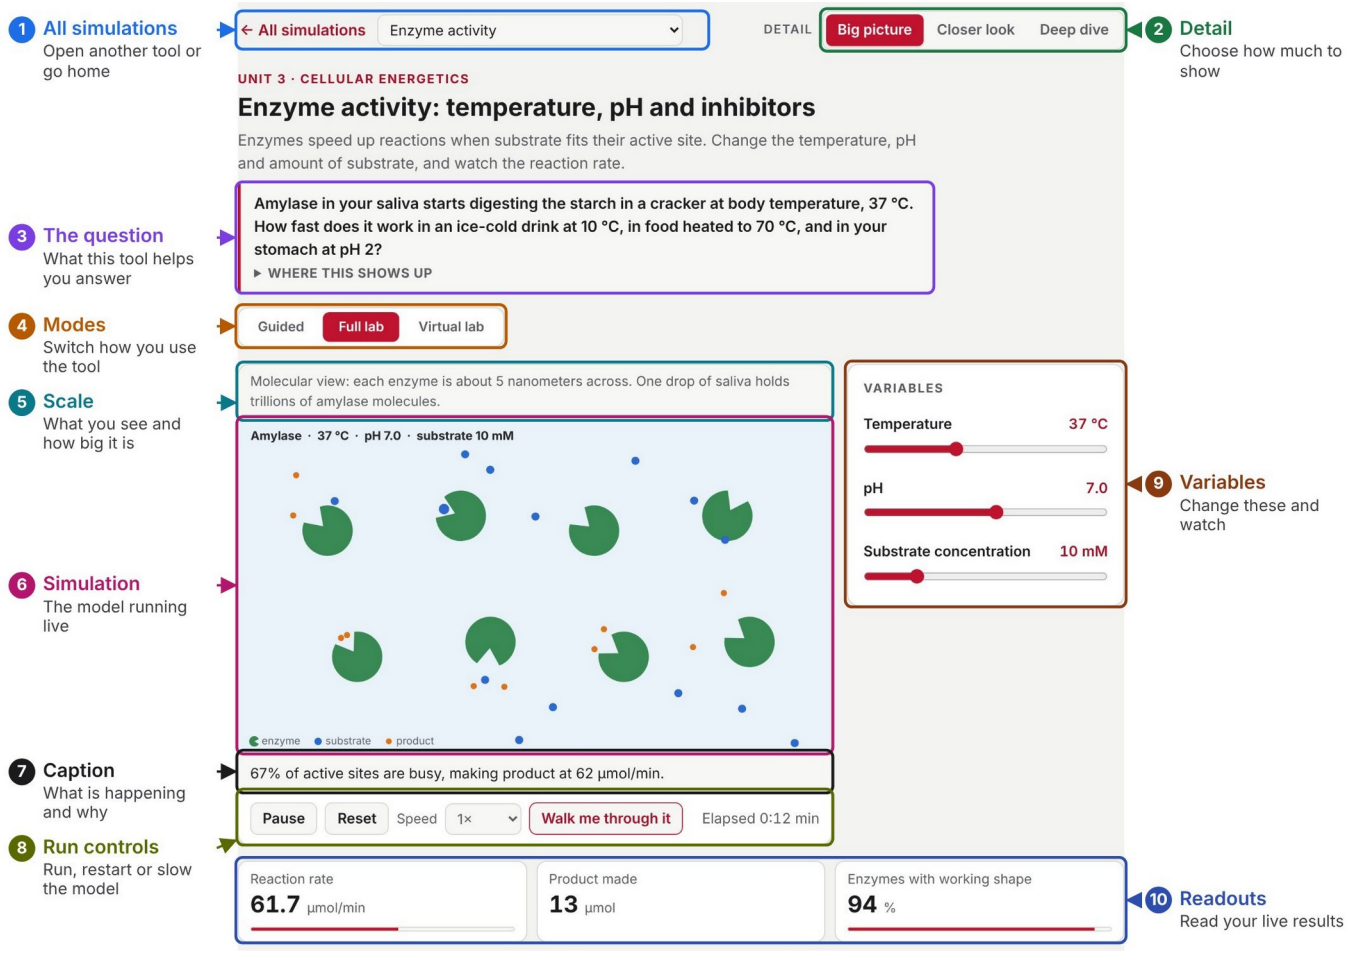

4. Step text. Explains this step. Step 1 is always the tool's real-world question.

5. Back, Next and Skip to the full lab. Move through the steps, or leave the walkthrough and open every control.

6. Play, Step, Reset and Speed. Play or pause the model, step it forward a moment at a time, start over, or slow it down.

Full lab: the bench

Students change the variables and watch the model respond.

1. All simulations and tool menu. Go back to the home page or jump straight to another tool.

2. Detail. Changes how many names, controls and how much math students see.

3. The question. The real-world question this tool answers. Where this shows up opens real uses of the idea.

4. Mode buttons. Switch between Guided, Full lab and any other modes this tool has.

5. Scale line. Says what students are looking at and how big it really is.

6. Simulation. The model running live. Students watch this respond when a variable changes.

7. Live caption. Explains what is happening right now, and why. It changes with the variables.

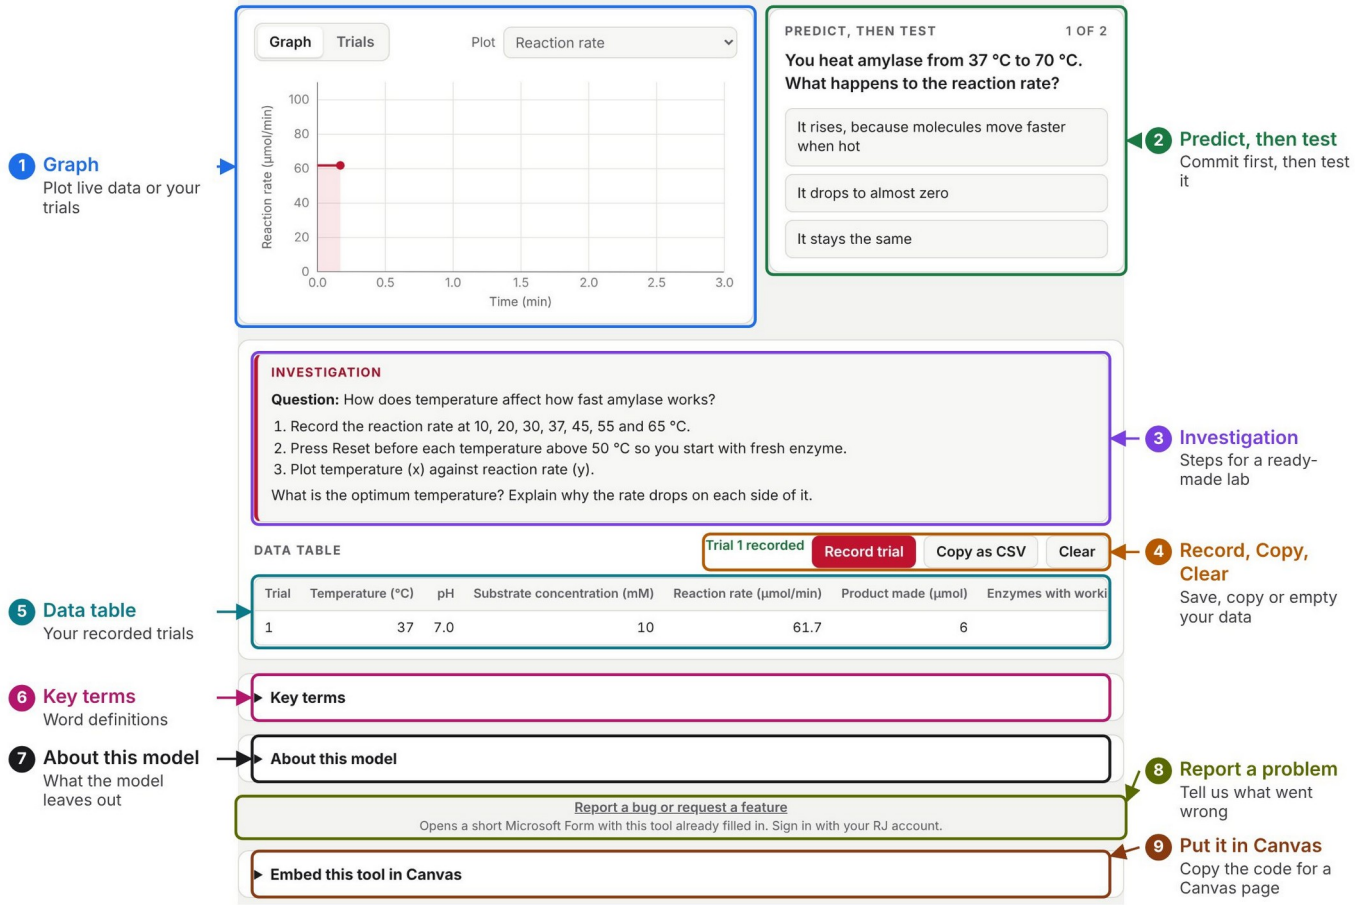

8. Pause, Reset, Speed and Walk me through it. Pause or restart the model, slow it down to 0.1×, or open the guided tour. When paused, Step moves it forward a moment at a time.

9. Variables. The sliders and switches students change. The model responds right away.

10. Readouts. The live numbers from the model, with units. Students read their results here.

Full lab: data and support

Below the bench, students test predictions, collect data and check the model.

1. Graph and Plot. Graph shows the live plot, and Plot chooses which reading it shows. Trials plots your recorded trials, using the x and y you choose.

2. Predict, then test. Students choose a prediction, then the tool runs the test and explains the result.

3. Investigation. A ready-made lab: the question, what to change and record, and what to explain.

4. Record trial, Copy as CSV and Clear. Record trial saves the current settings and readings as a row. Copy as CSV copies the table for Excel or Desmos. Clear empties it.

5. Data table. Every recorded trial. It stays in this browser on this device.

6. Key terms. Definitions of the words used in this tool.

7. About this model. What the model calculates and what it simplifies.

8. Report a bug or request a feature. Opens a short Microsoft Form with this tool already filled in.

9. Embed this tool in Canvas. Creates the code or link for a Canvas page, with pictures of each step.
